6ab8c3ef30f9767f87730407

**Project Name**

Streamlining IT Procurement: Automating Standard Laptop order with flow designer

**Maximum Marks**

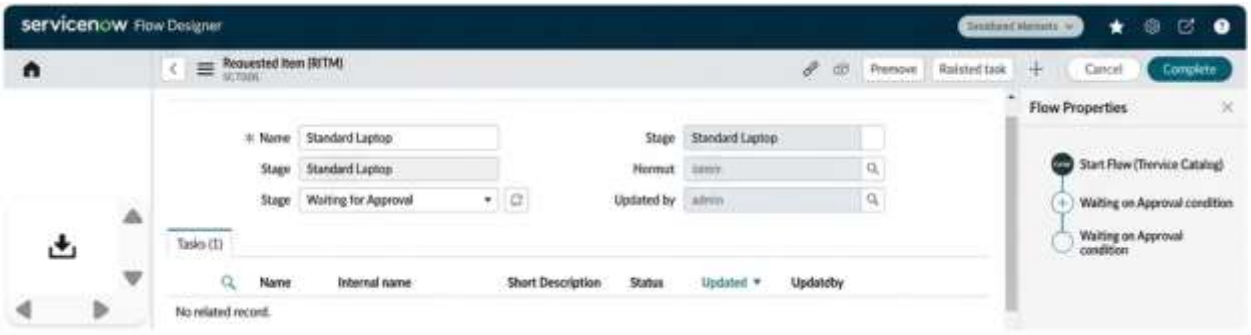

4 Marks

**Brainstorm & Idea Prioritization Template:**

The project focuses on automating the creation and assignment of a Catalog Task for Standard Laptop requests. The automation is designed to execute after the configured approval condition is reached, creating the required task under the related Requested Item and routing it to the Hardware assignment group for laptop configuration.

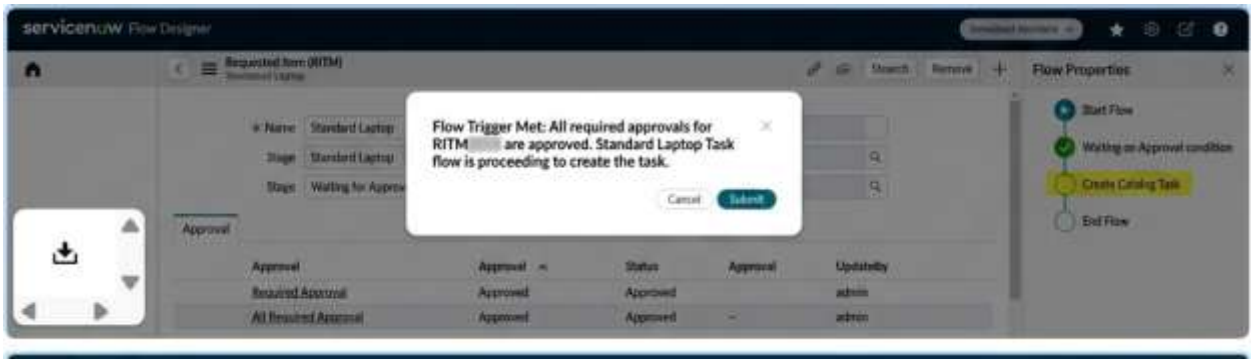

**Step-1: Team Gathering, Collaboration and Select the Problem Statement**

Problem Statement: Manual creation and assignment of configuration tasks for approved Standard Laptop requests can increase processing time and manual effort. The project addresses this by using ServiceNow Flow Designer automation to create the required Catalog Task and assign it to the Hardware team.

**Step-2: Brainstorm, Idea Listing and Grouping**

1. Automate Catalog Task creation after the configured approval condition is reached.
2. Connect the Standard Laptop Service Catalog item with the Standard Laptop Task Flow Designer flow.
3. Create the configuration task under the related Requested Item.
4. Automatically assign the task to the Hardware assignment group.

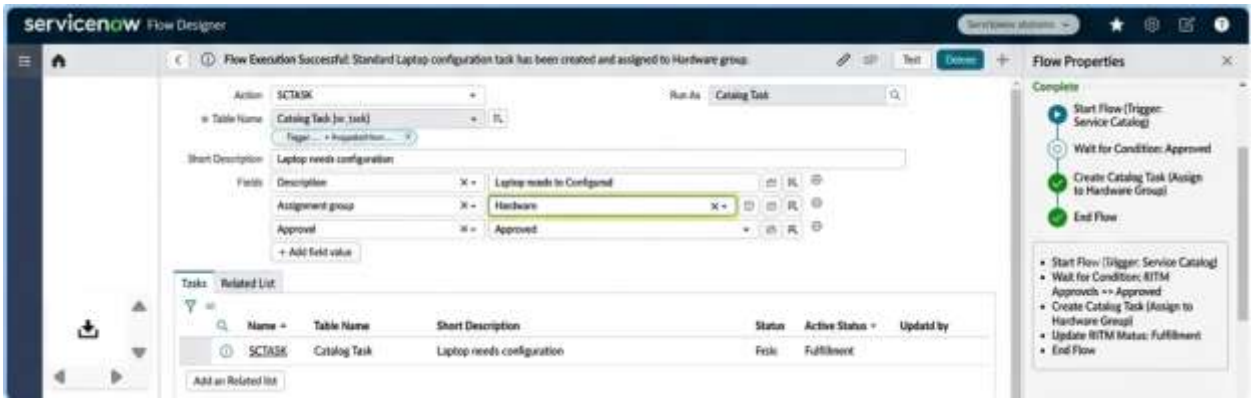

**Step-3: Idea Prioritization**

The selected approach is to use ServiceNow Flow Designer to automate the Standard Laptop task creation and assignment process. The Service Catalog provides the Standard Laptop catalog item through which users submit laptop requests. Once the request is approved, the configured flow creates a Catalog Task under the related Requested Item and assigns it to the Hardware team for configuration.

**Conclusion:**

By automating the Standard Laptop procurement process with ServiceNow's Flow Designer, the project reduces manual task creation and improves processing speed. The streamlined workflow ensures that approved laptop requests are automatically routed to the appropriate Hardware team for configuration, helping reduce user wait times, improve resource allocation, and provide a more efficient IT service process.
